Experience

IT Technical Support Intern

Trans-Asia Shipping Lines, Inc.

Cebu City

Feb–May 2026

- Deployed network infrastructure (PoE switches, APs, LAN/WAN, Starlink, airFiber) across 6 offices and 5 vessels.
- Resolved 30+ IT tickets, including recurring printer issues (~40% of volume) through resets, reconfiguration, and shared-printer setup.
- Upgraded 20+ PCs with SSD/RAM to reduce slow-performance complaints, while maintaining Windows Server and Linux server uptime.

Projects

IaaS Three-Tier E-Commerce Application with Autoscaling & IaC

Cloud Engineer / DevOps

Personal Project

April 2026–Present

- Architected a hub-spoke, three-tier Azure architecture using Terraform modules for Application Gateway, Web/App VM Scale Sets, Internal Load Balancer, and private PostgreSQL Flexible Server, with no public IPs on compute instances, Bastion-based administration, and least-privilege NSGs isolating database resources.
- Configured Azure Monitor Autoscale (60%/30% CPU thresholds) on Web/App VM Scale Sets and validated scale-out/scale-in behavior by stress-testing the NGINX web tier, capturing 5-stage evidence through Datadog dashboards and alerts.
- Delivered a GitHub Actions CI/CD pipeline authenticated via **OIDC** federated identity (Terraform plan on PR, apply on merge) with secrets centralized in Azure Key Vault.

Secure Enterprise Infrastructure on Azure (IaaS Platform & Terraform)

Cloud Engineer / DevOps

Personal Project

March 2026–Present

- Architected and deployed a 3-environment (Dev/Staging/Prod) Azure infrastructure platform using Terraform modules (IaC), replacing manual Azure Portal provisioning with repeatable, version-controlled deployments.
- Designed a zero-public-IP network architecture (Azure Bastion, NAT Gateway, NSGs) and a GitHub Actions CI/CD pipeline with OIDC federated authentication and a manual approval gate on Production.
- Implemented observability using Azure Monitor, Log Analytics, and KQL-based alert rules to detect VM downtime, high CPU usage, and SSH brute-force attempts.

Serverless Microservices Architecture (PaaS Platform & Terraform)

Cloud Engineer / App Platform

Personal Project

Dec 2025–Present

- Architected event-driven microservices on Azure Functions (Node.js) with Cosmos DB partitioned by email/id, decoupling Login, Register, and Visitor Counter behind a React frontend.
- Secured secrets via Managed Identity + Key Vault, enforced domain-scoped CORS, and traced requests end-to-end with Application Insights all provisioned via Terraform.

Skills & Training

- **Training:** AZ-104 Azure Administrator Associate course in progress; target exam Q3 2026.
- **Cloud & DevOps:** Microsoft Entra ID (IAM, RBAC), Microsoft 365, Azure Policy, Virtual Machines, VNets/Subnets, NSGs, Azure Bastion, Load Balancer, DNS, Azure Monitor, Recovery Services Vault (Backup), Azure Functions, App Service, Cosmos DB, Key Vault, Application Insights, Bicep, Terraform (IaC), GitHub Actions (CI/CD), Docker, Azure Container Registry, Datadog.
- **Networking & Infrastructure:** TCP/IP, DHCP, LAN/WAN, PoE Switches, Access Points, Ruijie Cloud.
- **Operating Systems & Scripting:** Linux, Windows Server, PowerShell Basic, Bash, Azure CLI, Git.

Education

Cebu Technological University - Argao Campus

Bachelor of Science in Information Technology.

Argao, Cebu

June 2026
